

Recall: Horizontal Notation

0	k	len(b)
b	<= sorted	>=

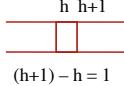

Example of an assertion about a sequence b. It asserts that:

1. $b[0..k-1]$ is sorted (i.e. its values are in ascending order)
2. Everything in $b[0..k-1]$ is \leq everything in $b[k..len(b)-1]$

0	h	k
b		

Given index **h** of the **first element** of a segment and index **k** of the **element that follows that segment**, the number of values in the segment is **k - h**.

$b[h..k-1]$ has **k - h** elements in it.

Partition Algorithm Implementation

```
def partition(b, h, k):
    """Partition list b[h..k] around a pivot x = b[h]"""
    i = h; j = k+1; x = b[h]
    # invariant: b[h..i-1] < x, b[i] = x, b[j..k] >= x
    while i < j:
        if b[i+1] >= x:
            # Move to end of block.
            _swap(b,i+1,j-1)
            j = j - 1
        else:
            # b[i+1] < x
            _swap(b,i,i+1)
            i = i + 1
    # post: b[h..i-1] < x, b[i] is x, and b[i+1..k] >= x
    return i

Dutch National Flag Variant

- Sequence of integer values
 - ‘red’ = negatives, ‘white’ = 0, ‘blues’ = positive
 - Only rearrange part of the list, not all

Dutch National Flag Algorithm

```
def dnf(b, h, k):
    """Returns: partition points as a tuple (i,j)"""
    t = h; i = k+1, j = k;
    # inv: b[h..t-1] < 0, b[t..i-1] ?, b[i..j] = 0, b[j+1..k] > 0
    while t < i:
        if b[t] < 0:
            _swap(b,i-1,t)
            t = t+1
        elif b[i] == 0:
            i = i-1
        else:
            _swap(b,i,j)

    # post: b[h..t-1] < 0, b[i..j] = 0, b[j+1..k] > 0
    return (i,j)
```

Changing the Invariant

- Different invariants = different code
 - Need to change how we initialize, stop
 - Also need to change the body of the loop

pre:	b	h	?	k		
post:	b	h	?	k		
inv:	b	h	t	i	j	k
	pre: t=h,	i=h,	j=k	post: t=j+1
