Lecture 9: Memory in Python

CS 1110

Introduction to Computing Using Python

*Text in fusia and extra slides were added after lecture
for clarification. See slides 24 - 27.*

[E. Andersen, A. Bracy, D. Fan, D. Gries, L. Lee,
S. Marschner, C. Van Loan, W. White]

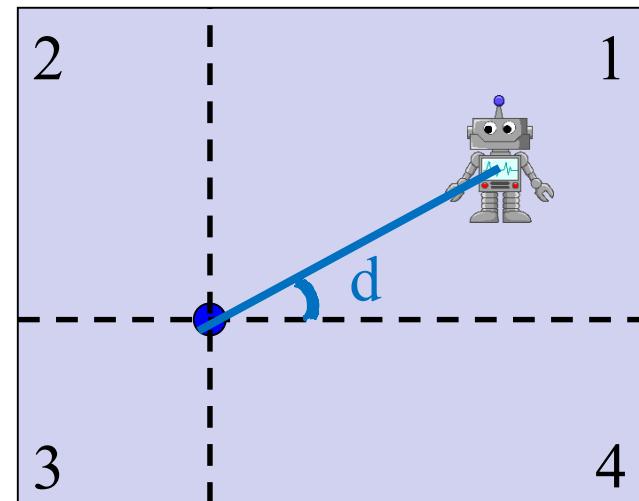

Announcements

- A1 revision process: A1 closed now on CMS for grading. Set your CMS notifications to “receive email when ...” When feedback is released, expected on Mar 13 afternoon, read *resubmission instructions*
- A2 to be released Thursday

Review: Nested Conditionals

Where is the robot?

- Angle of the robot relative to the sensor is d degrees, where d is non-negative
- Robot is in which quadrant?
- To avoid ambiguity, use this convention:
 - 1 if $0 \leq d < 90$
 - 2 if $90 \leq d < 180$
 - 3 if $180 \leq d < 270$
 - 4 if $270 \leq d < 360$

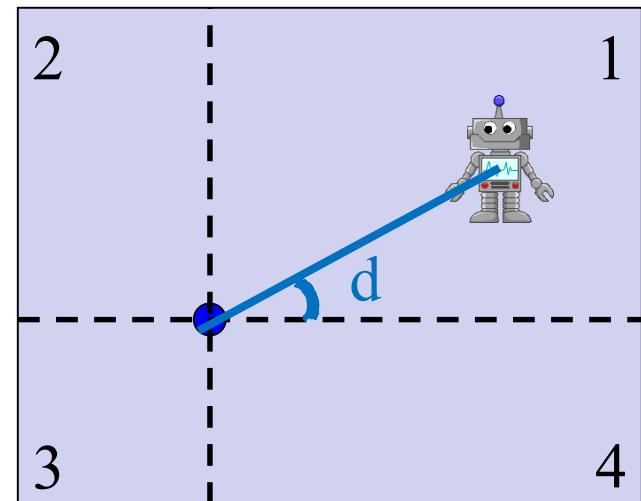

WARNING
Robot Operating in Quadrant 1

Can solve using **if-elif-elif...** Other options?

Nesting Conditionals

- Separate choices into 2 general categories
- Subdivide each category into subcategories
- Subdivide each subcategory further...

```
if <above x-axis>:  
    if <left of y-axis>:  
  
        else:  
  
    else:  
        if <left of y-axis>:  
  
            else:
```

- 1 if $0 \leq d < 90$
- 2 if $90 \leq d < 180$
- 3 if $180 \leq d < 270$
- 4 if $270 \leq d < 360$

See quadrants.py

Memory in Python

Global Space

- **Global Space**

- What you “start with”
- Stores global variables
- Lasts until you quit Python

Global Space

x 4

x = 4

Enter Heap Space

- **Global Space**

- What you “start with”
- Stores global variables
- Lasts until you quit Python

- **Heap Space**

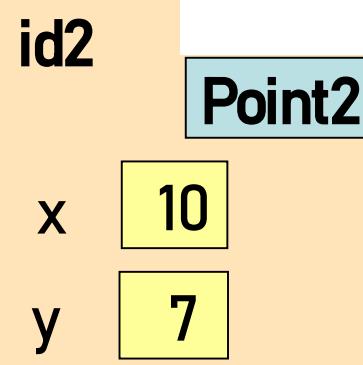

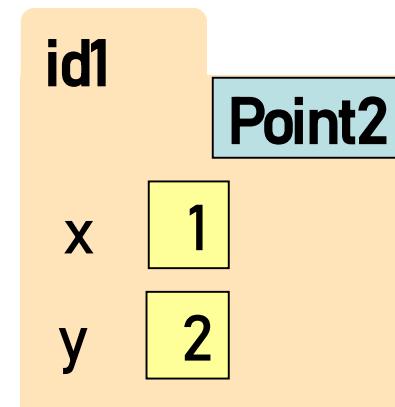

- Where “folders” are stored
- Have to access indirectly

```
x = 4  
p = shape.Point2(1,2)  
q = shape.Point2(10,7)
```

Global Space

x	4
p	id1
q	id2

Heap Space

p & q live in Global Space. Their folders live on the Heap.

Calling a Function Creates a Call Frame

What's in a Call Frame?

- Boxes for parameters **at the start of the function**
- Boxes for variables local to the function **as they are created**

```
1 def adjust_x_coord(pt, n):  
    pt.x = pt.x + n  
  
    x = 4  
    p = shape.Point2(1,2)  
    adjust_x_coord(p, x)
```

Global Space

x	4
p	id1

Heap Space

id1	Point2
x	1
y	2

Call Frame

adjust_x_coord	1
pt	id1
n	4

Calling a Function Creates a Call Frame

What's in a Call Frame?

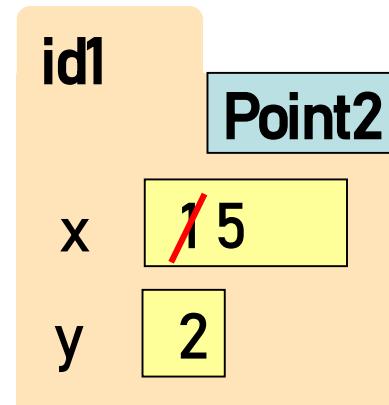

- Boxes for parameters **at the start of the function**
- Boxes for variables local to the function **as they are created**

```
def adjust_x_coord(pt, n):
    pt.x = pt.x + n
    1
    x = 4
    p = shape.Point2(1,2)
    adjust_x_coord(p, x)
```

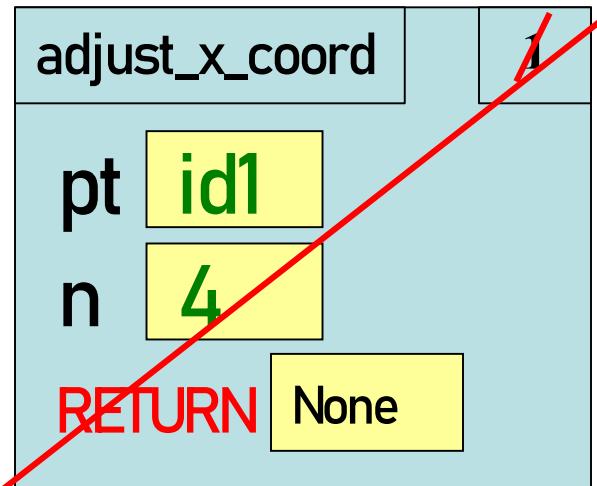

Global Space

x	4
p	id1

Heap Space

Call Frame

Putting it all together

- **Global Space**

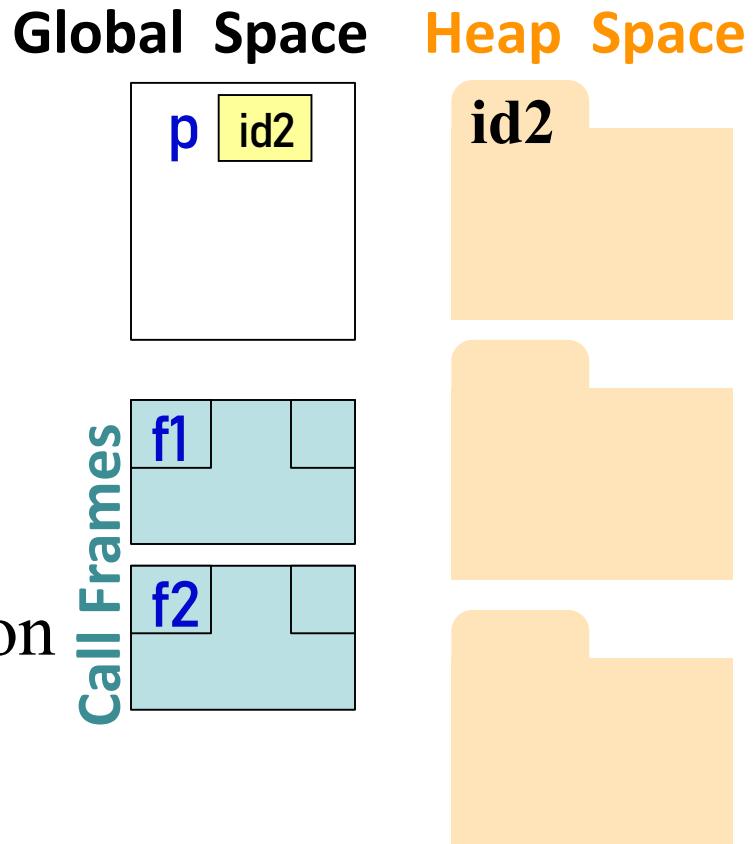

- What you “start with”
- Stores global variables
- Lasts until you quit Python

- **Heap Space**

- Where “folders” are stored
- Have to access indirectly

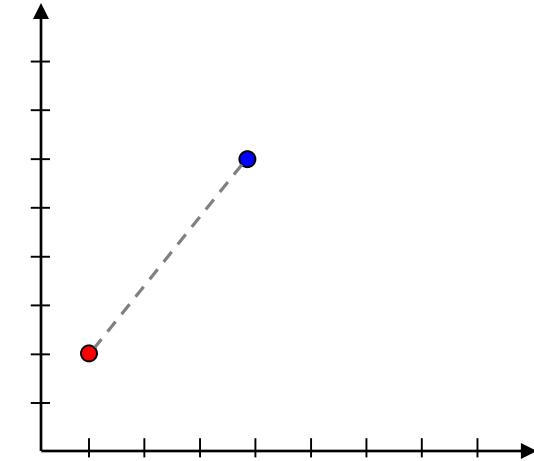

- **Call Frames**

- Parameters
- Other variables local to function
- Lasts until function returns

Two Points Make a Line

```
start = shape.Point2(0,0)
stop = shape.Point2(0,0)
print("Where does the line start?")
x = input("x: ")
start.x = int(x)
y = input("y: ")
start.y = int(y)
print("The line starts at ("+x+","+y+").")
print("Where does the line stop?")
x = input("x: ")
stop.x = int(x)
y = input("y: ")
stop.y = int(y)
print("The line stops at ("+x+","+y+").")
```

Where does the line start?

x: 1

y: 2

The line starts at (1,2).

Where does the line stop?

x: 4

y: 6

The line stops at (4,6).

Redundant Code is BAAAAAD!

```
start = shape.Point2(0,0)
```

```
stop = shape.Point2(0,0)
```

```
print("Where does the line start?")
```

```
x = input("x: ")
```

```
start.x = int(x)
```

```
y = input("y: ")
```

```
start.y = int(y)
```

```
print("The line starts at (" + x + "," + y + ").")
```

```
print("Where does the line stop?")
```

```
x = input("x: ")
```

```
stop.x = int(x)
```

```
y = input("y: ")
```

```
stop.y = int(y)
```

```
print("The line stops at (" + x + "," + y + ").")
```

Let's make a function!

```
def configure(pt, role):  
    print("Where does the line " + role + "?")  
    x = input("x: ")  
    pt.x = int(x)  
    y = input("y: ")  
    pt.y = int(y)  
    print("The line " +role+ "s at (""+x+ ","+y+").")
```

```
start = shape.Point2(0,0)  
stop = shape.Point2(0,0)  
configure(start, "start")  
configure(stop, "stop")
```

Still a bit of redundancy

```
def configure(pt, role):  
    print("Where does the line " + role + "?")  
    x = input("x: ")  
    pt.x = int(x)  
    y = input("y: ")  
    pt.y = int(y)  
    print("The line " +role+ "s at (""+x+ ","+y+ ").")
```

```
start = shape.Point2(0,0)  
stop = shape.Point2(0,0)  
configure(start, "start")  
configure(stop, "stop")
```

Yay, Helper Functions!

```
def get_coord(name):
    x = input(name+": ")
    return int(x)

def configure(pt, role):
    print("Where does the line " + role + "?")
    pt.x = get_coord("x")
    pt.y = get_coord("y")
    print("The line " +role+ "s at ("+x+ ","+y+ ").")"

start = shape.Point2(0,0)
stop = shape.Point2(0,0)
configure(start, "start")
configure(stop, "stop")
```

Frames and Helper Functions

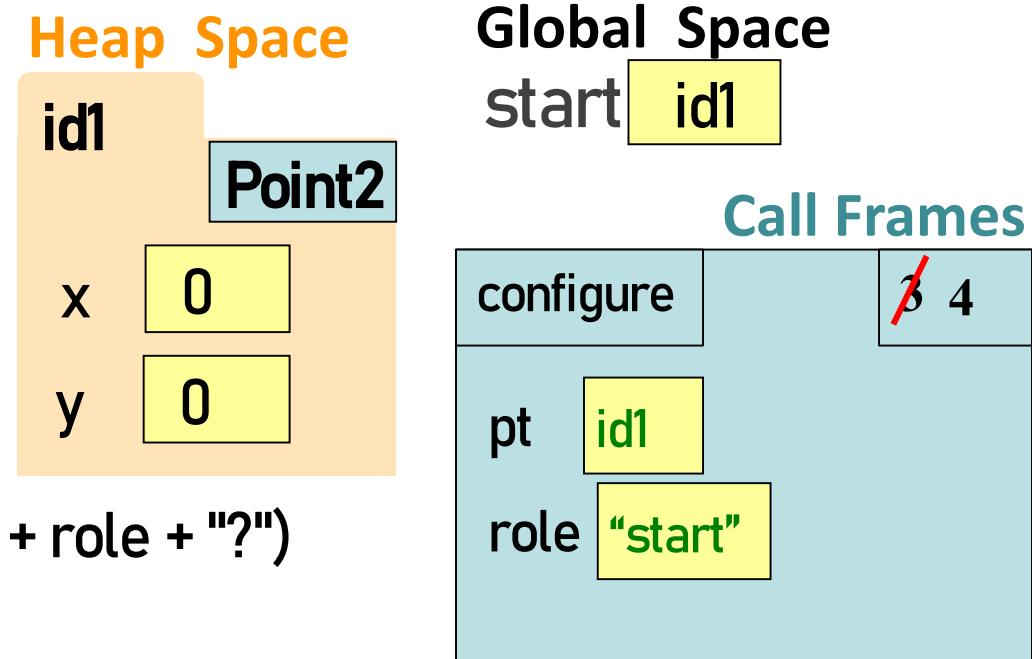

- Functions can call each other!
- Each call creates a *new call frame*
- Writing the same several lines of code in 2 places? Or code that accomplishes some conceptual sub-task? Or your function is getting too long? Write a **helper function!** Makes your code easier to
 - **read**
 - **write**
 - **edit**
 - **debug**

Drawing Frames for Helper Functions (1)

```
def get_coord(name):  
1   x = input(name+": ")  
2   return int(x)
```

```
def configure(pt, role):  
3   print("Where does the line " + role + "?")  
4   pt.x = get_coord("x")  
5   pt.y = get_coord("y")  
6   print("The line " +role+ "s at ("+str(pt.x)+  
      ","+str(pt.y)+ ".") )
```

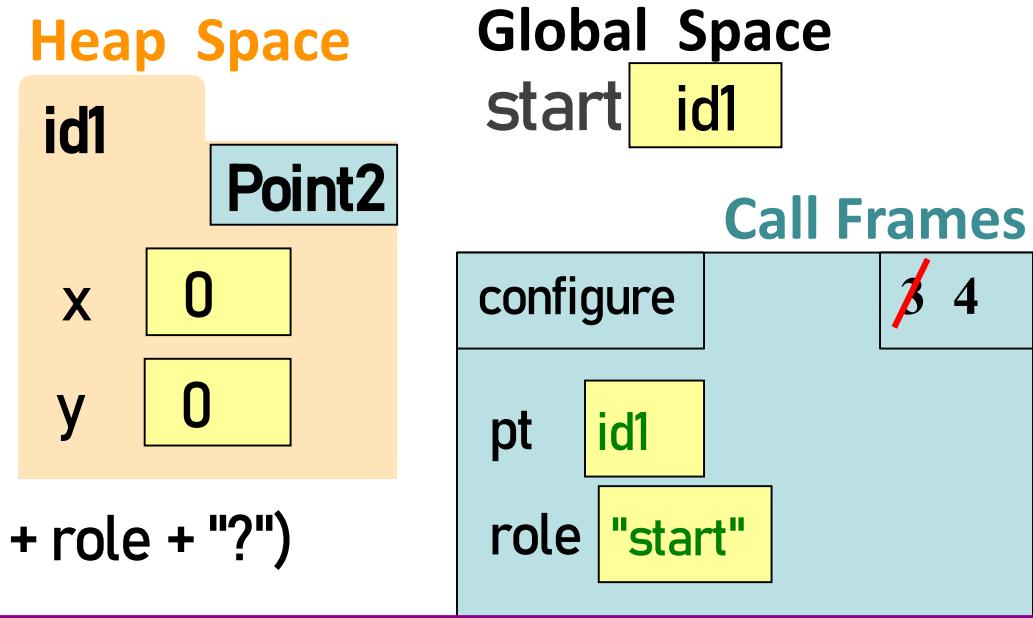

```
start = shape.Point2(0,0)  
configure(start, "start")
```

Q1: what do you do next?

```
def get_coord(name):  
    1 | x = input(name+": ")  
    2 | return int(x)
```

```
def configure(pt, role):  
    3 | print("Where does the line " + role + "?")  
    4 | → pt.x = get_coord("x")  
    5 | pt.y = get_coord("y")  
    6 | print("The line " +role+ "s at  
          |     ","+str(pt.y)+ ".")  
  
start = shape.Point2(0,0)  
configure(start, "start")
```

- A: Cross out the `configure` call frame.
- B: Create a `get_coord` call frame.
- C: Cross out the 4 in the call frame.
- D: A & B
- E: B & C

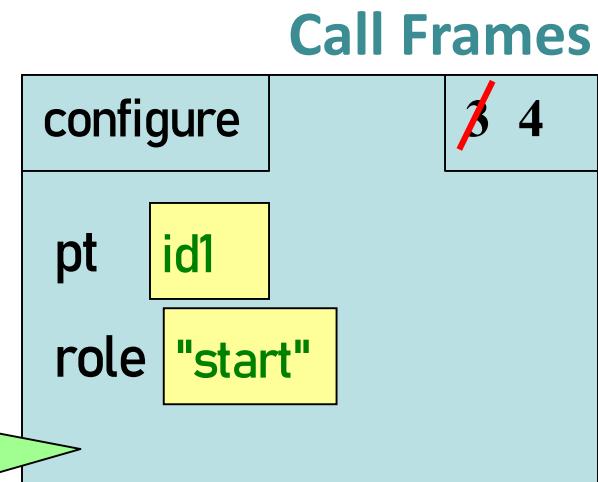

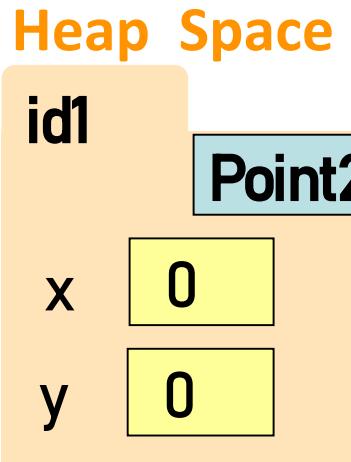

Drawing Frames for Helper Functions (2)

```
def get_coord(name):  
    1   x = input(name+": ")  
    2   return int(x)
```

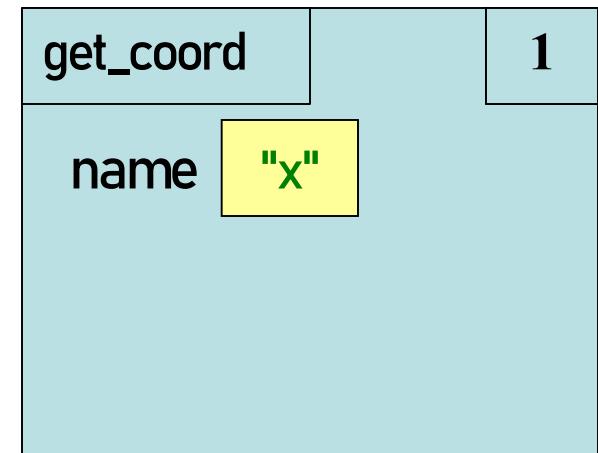

```
def configure(pt, role):  
    3   print("Where does the line " + role + "?")  
    4   pt.x = get_coord("x")  
    5   pt.y = get_coord("y")  
    6   print("The line " +role+ "s at ("+str(pt.x)+  
          ", "+str(pt.y)+ ".") )
```

```
start = shape.Point2(0,0)  
configure(start, "start")
```

Not done!
Do not cross out!!

A
B CORRECT
C
D
E

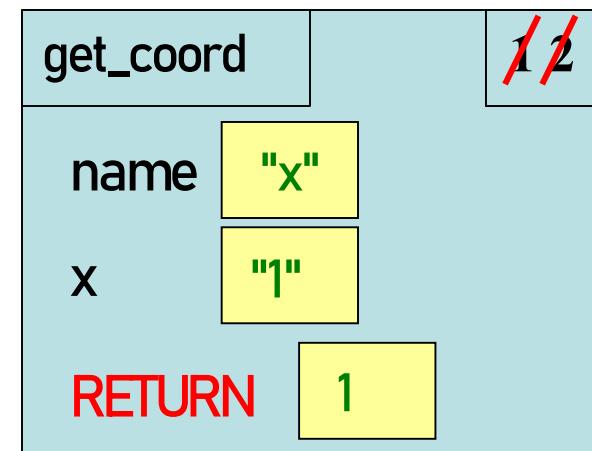

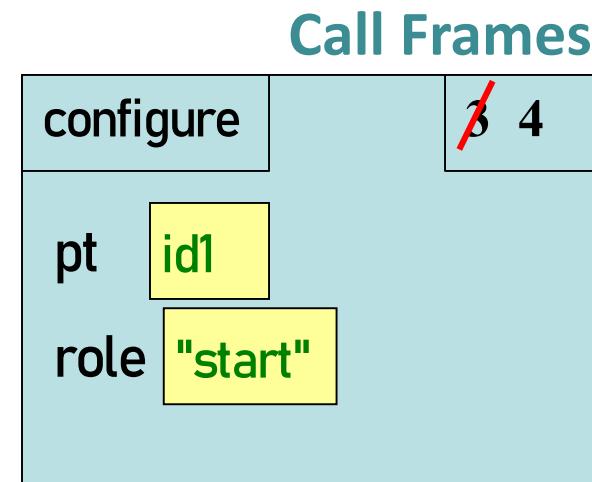

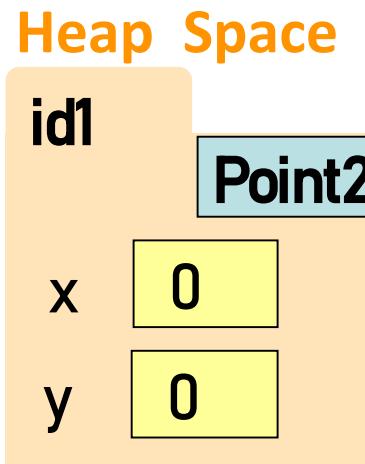

Drawing Frames for Helper Functions (3)

```
def get_coord(name):  
    1 | x = input(name+": ")  
    2 | return int(x)
```

*Assume user types
1 at Python shell
prompt*

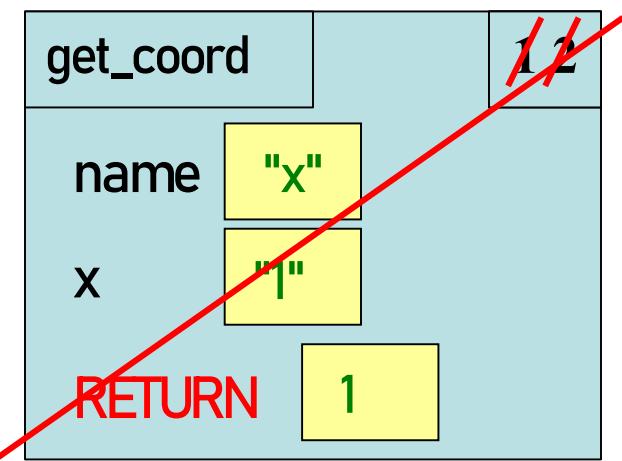

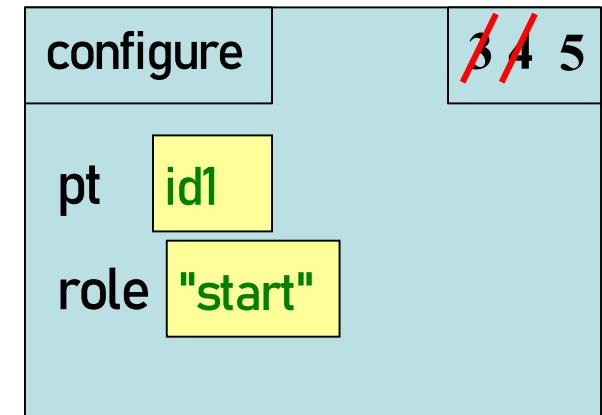

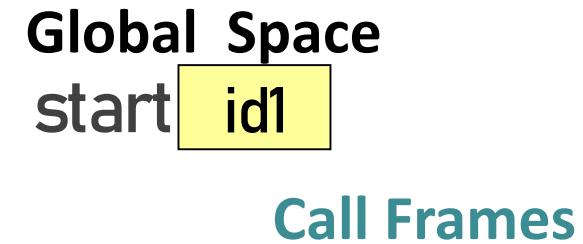

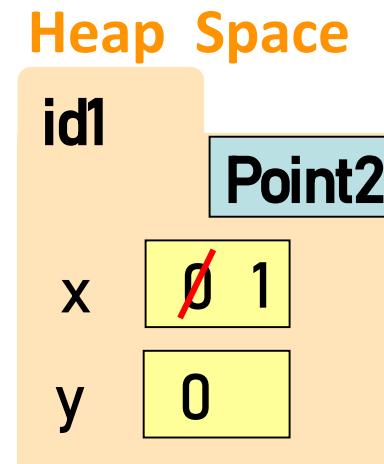

```
def configure(pt, role):  
    3 | print("Where does the line " + role + "?")  
    4 | pt.x = get_coord("x")  
    5 | pt.y = get_coord("y")  
    6 | print("The line " +role+ "s at ("+str(pt.x)+  
          ", "+str(pt.y)+ ".") )  
  
start = shape.Point2(0,0)  
configure(start, "start")
```

Drawing Frames for Helper Functions (4)

```
def get_coord(name):  
1   x = input(name+": ")  
2   return int(x)
```

```
def configure(pt, role):  
3   print("Where does the line " + role + "?")  
4   pt.x = get_coord("x")  
5   pt.y = get_coord("y")  
6   print("The line " +role+ "s at ("+str(pt.x)+  
         ","+str(pt.y)+ ".") )  
  
start = shape.Point2(0,0)  
configure(start, "start")
```

Drawing Frames for Helper Functions (5)

```
def get_coord(name):
```

```
1   x = input(name+": ")  
2   return int(x)
```

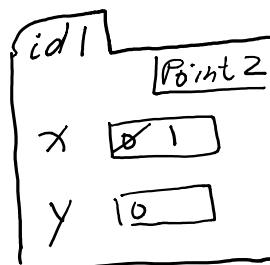

```
def configure(pt, role):
```

```
3   print("Where does the line " + role + "?")  
4   pt.x = get_coord("x")  
5   pt.y = get_coord("y")  
6   print("The line " +role+ "s at (" +str(pt.x)+  
       ", "+str(pt.y)+ ".") )
```

```
start = shape.Point2(0,0)
```

```
configure(start, "start")
```

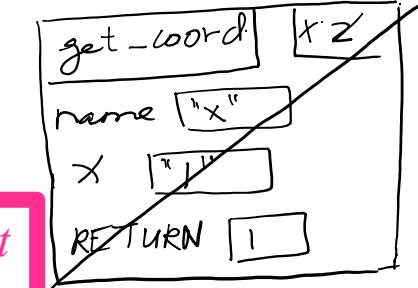

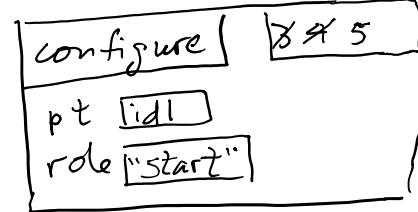

Heap Space

Global Space

start Fld1

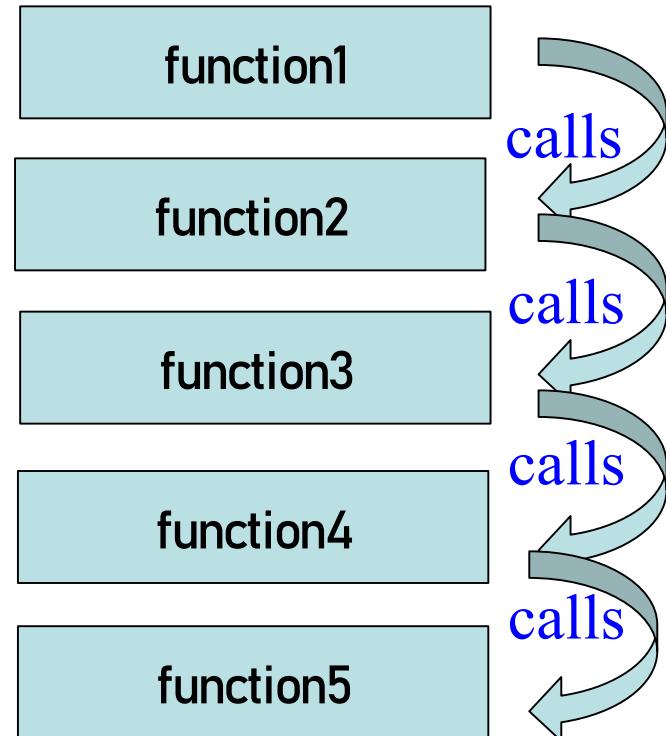

Call Frames

To do: Finish the diagram, assuming that
the user types 2 at Python shell prompt
when this `get_coord` call executes.

The Call Stack

- The set of function frames drawn in call order
- Functions frames are “stacked”
 - Cannot remove one above w/o removing one below
- Python must keep the **entire stack** in memory
 - Error if it cannot hold stack (“stack overflow”)

Errors and the Call Stack

```
def get_coord(name):  
    x = input(name+": ")  
    return int(x1)  
  
def configure(pt, role):  
    print("Where does the line " +  
        pt.x = get_coord("x")  
  
    pt.y = get_coord("y")  
    print("The line " +role+ "s at ("+x+", "+y+").")  
  
start = shape.Point2(0,0)  
configure(start, "start")
```

Where does the line start?
x: 1
Traceback (most recent call last):
 File "v3.py", line 19, in <module>
 configure(start, "start")
 File "v3.py", line 14, in configure
 pt.x = get_coord("x")
 File "v3.py", line 10, in get_coord
 return str(x1)
NameError: name 'x1' is not defined

Q2: what does the call stack look like at this point in the execution of the code?

def f3():

 print("f3")

def f2():

 print("f2")

f3()

f3()

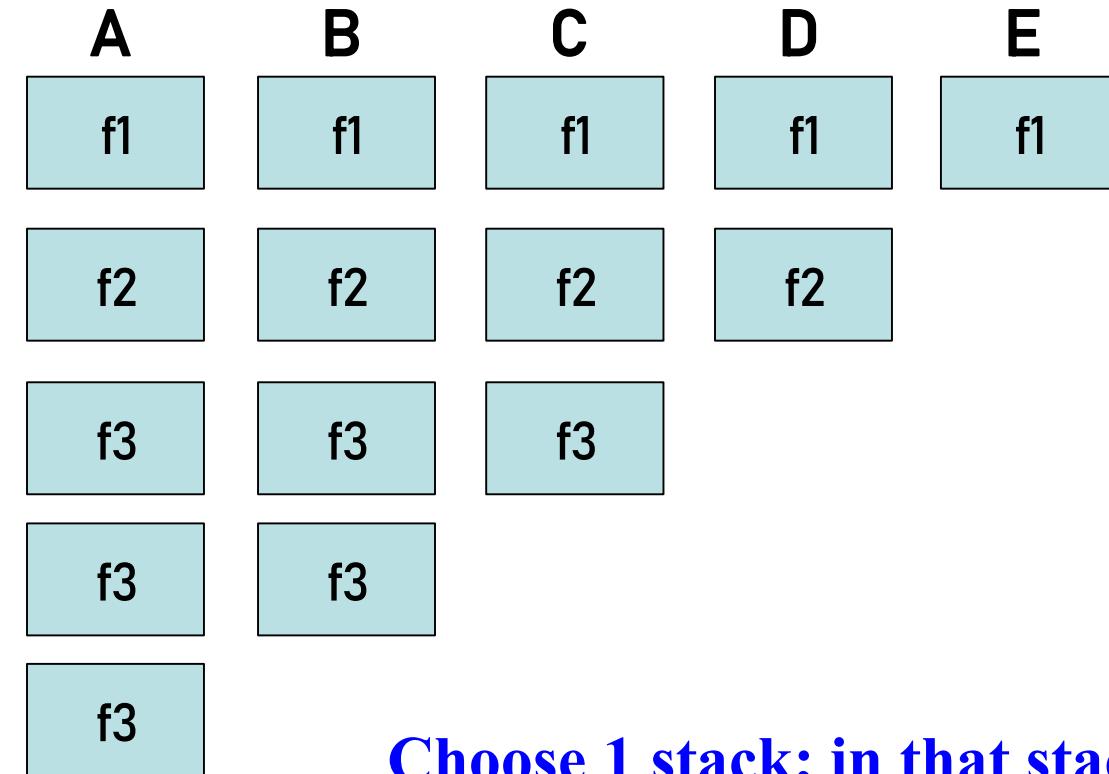

f3()

def f1():

 print("f1")

f2()

f1()

Choose 1 stack; in that stack cross out any frames that should have ended.

Modules and Global Space

Import

```
>>> import math
```

- Creates a global **variable** (same name as module)
- Puts variables, functions of module in a **folder**
- Puts folder id in the global **variable**

Global Space

math

id5

Heap Space

id5

module

pi

3.141592

e

2.718281

functions

Modules vs Objects

```
>>> import math  
>>> math.pi
```

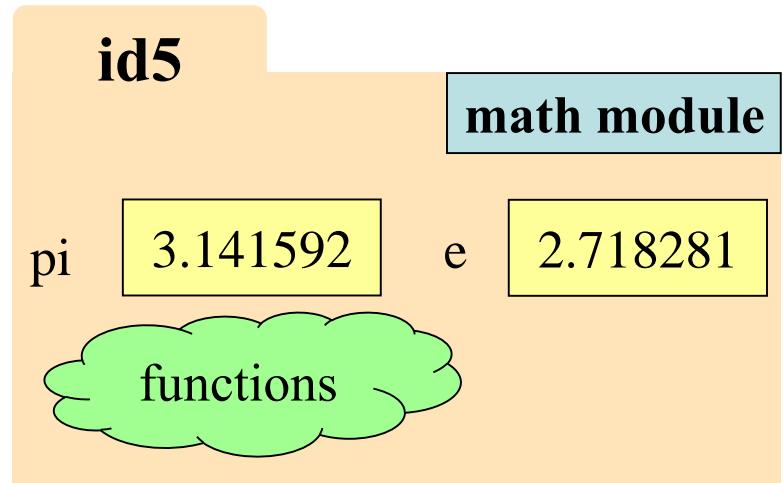

```
>>> p = shapes.Point3(5,2,3)  
>>> p.x
```

Global Space

math id5

p id3

Heap Space

id3

x 5
y 2
z 3
Point3

Functions and Global Space

A function definition

- Creates a global variable (same name as function)
- Creates a **folder** for body
- Puts folder id in the global variable

```
INCHES_PER_FT = 12  
  
def get_feet(ht_in_inches):  
    return ht_in_inches // INCHES_PER_FT
```

Body

Global Space

INCHES_PER_FT

12

get_feet

id6

Heap Space

id6

function

Body

Function Definition vs. Call Frame

```
1 INCHES_PER_FOOT = 12
2
3 def get_feet(ht_in_inches):
4     feet = ht_in_inches // INCHES_PER_FOOT
5     return feet
6
7 f = get_feet(68)
8 print("You are at least "+str(f)+" feet tall!")
```

<< First < Back Step 6 of 7 Forward > Last >>

→ line that has just executed

→ next line to execute

Call Frame
(memory for function call)
It's alive!

Global Space

Globals

global
INCHES_PER_FOOT 12
get_feet id1

Frames

get_feet
ht_in_inches 68
feet 5
Return value 5

Objects

id1:function
get_feet(ht_in_inches)

Heap Space
(Function definition goes here)

Storage in Python

- **Global Space**

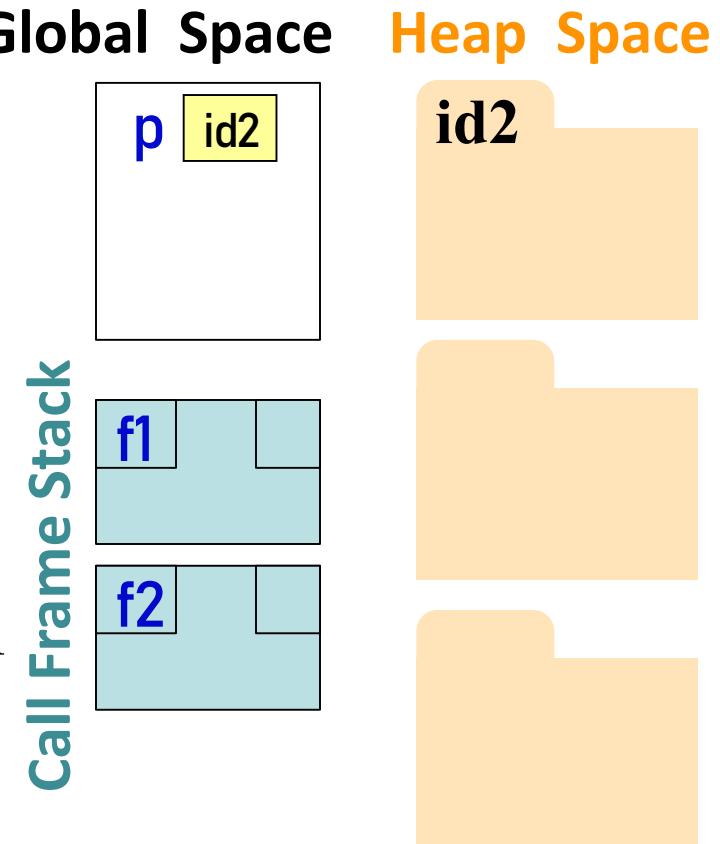

- What you “start with”
- Stores global variables, modules & functions
- Lasts until you quit Python

- **Heap Space**

- Where “folders” are stored
- Have to access indirectly

- **Call Frame Stack**

- Parameters
- Other variables local to function
- Lasts until function returns

Don't draw module folder, function folder

Folders that we **do not draw**:

- Module folder is created upon **import**, for example,

import math

- Function folder is created with **def** (the function header), for example,

def get_feet(height_in_inches):

Don't draw those folders and the variables that store their ids; we only explained those folders to explain what you see in Python Tutor. *Do not draw them.*

Q3: what does the call stack look like at this point in the execution of the code?

def f3():

 print("f3")

A
